

LINE Follower

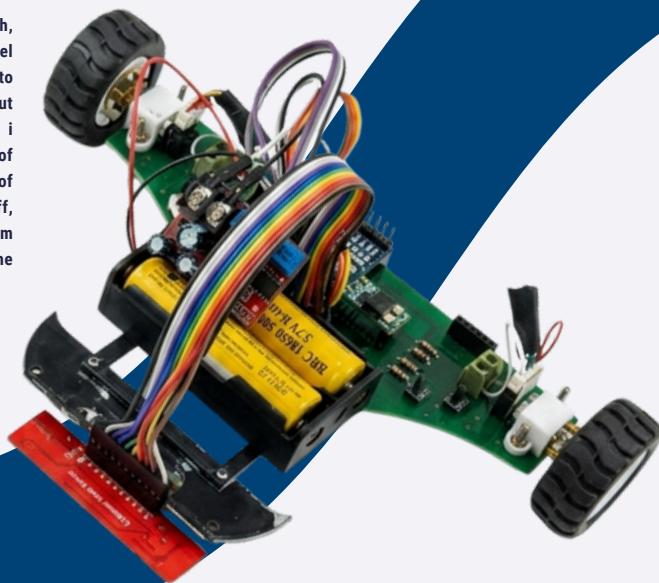

MODULAR, PORTABLE LINE FOLLOWER ROBOT

A line follower robot i built from scratch, schematic, PCB, and all. it uses an 8 channel sensor array to track the line and a PID loop to stay on it and handle sharp turns without freaking out. also has bluetooth built in so i could tune the PID values live instead of reuploading code every time. spent a lot of time getting the tuning right but it paid off, won 1st place at TechnoXian and now im heading to Thailand to represent Egypt at the world competition
